TECHNICAL REPORT · PORTFOLIO ANALYTICS

Credit Card Portfolio Performance & Weekly Revenue Analytics

A business-facing technical review of 10,108 cardholder accounts, US$56.5M of gross billings and the Week 53 incremental load — covering data architecture, analytical methodology, key findings and a prioritised set of revenue actions.

SECTION 01

Executive summary

The card portfolio generated **US$56.52M of gross billings** in FY2025 across 10,108 accounts. But only **US$10.98M — 19.4% — is revenue the business actually keeps**. The remaining 80.6% is transaction value settled through to merchants. Almost every growth conversation about this portfolio is being held on the wrong number, and that single framing error is the most expensive finding in this report.

$56.52M	$10.98M	57.5%	6.06%
GROSS BILLINGS YTD	ECONOMIC REVENUE (INTEREST + FEES)	CARD ACTIVATION RATE	DELINQUENCY RATE
+$1.20M from Week 53 load	19.4% of gross billings	4,296 accounts never activated	~613 accounts; self-employed 1.82×

Four findings drive the conclusions that follow. **First, growth is seasonal, not structural.** Quarterly billings sat inside a US$0.9M band all year (Q1 $14.0M → Q4 $13.3M). The celebrated 28.8% week-over-week jump in Week 53 is a holiday-

and-acquisition artefact: the 185 accounts loaded that week represent 1.8% of the base and can explain at most ~1.7% of the week's billings. Annualising a single December week to a US$62.5M run-rate would overstate the business by roughly 11%.

Second, the activation gap is the largest un-monetised asset on the balance sheet. 4,296 accounts — 42.5% of the file — have not transacted within 30 days of issue. Moving activation from 57.5% to 62.5% is worth **US$1.70M of annual gross billings**, or US$1.13M in cash in the first year, for a programme cost of roughly US$49K measured against the portfolio's own acquisition cost.

Third, acquisition spend is inversely correlated with monetisation. The Blue card absorbs 90.8% of acquisition spend, delivers 83.5% of billings and returns 53.0× spend. The three premium tiers absorb 9.2% of spend, deliver 16.5% of billings and return 104× — and their *fee intensity falls* as tier rises, from 5.8% of revenue on Blue to 1.8% on Platinum. The premium portfolio is priced as if it were a transaction product.

Fourth, risk is concentrated in one occupation and one geography. Self-employed cardholders are 14.9% of billings but carry 1.65 of the 6.06 delinquency points — a conditional delinquency rate near 11%, roughly twice the portfolio average. Three states (TX, NY, CA) carry 68% of billings.

> **WHAT THE REPORT RECOMMENDS**
>
> A sequenced three-lever programme — activation recovery, a third-geography growth push, and self-employed underwriting discipline — worth **US$3.65M of annual gross billings (+6.4%)** and **US$2.23M of first-year cash**. Separately, retire two practices: quoting portfolio scale on gross billings, and reading the Week-53 uplift as organic growth.

SECTION 02

Data and methodology overview

2.1 Source data and schema

The analysis draws on two related tables held in a PostgreSQL database (`CCDB`) and served through a Power BI semantic layer. Both tables are keyed on `CLIENT_ID` at a strict one-to-one grain: one row per account in the customer table, one row per account-week in the transaction table. The published figures reconcile to 10,108 accounts and 18 + 15 columns respectively.

TABLE 1 — ANALYTICAL BASE TABLES

TABLE	ROWS	COLUMNS	PRINCIPAL MEASURES AND DIMENSIONS
CC_DETAIL	10,108	18	Card category (Blue/Silver/Gold/Platinum), interest earned, credit limit, annual fees, week number and start date, quarter, acquisition cost, revolving balance, average utilisation ratio, delinquency flag, expenditure type, transaction amount and count
CUSTOMER	10,108	15	Age, gender, state, marital status, dependants, personal loan, car and house ownership, education, occupation, income, contact channel, satisfaction score (CSS)
CUST_ADD / CC_ADD	185	18 / 15	Identical schemas; the Week 53 (31 Dec 2025) incremental load into the same database

2.2 Processing architecture

The pipeline is a five-stage incremental-load design. Its most important property is that the weekly feed is *additive*: a new week is appended and every downstream KPI recomputes without a rebuild. This is what makes week-over-week reporting defensible, and it is verifiable — the arithmetic in Section 4.1 confirms it to the cent.

1. **Extract and stage** — source extracts prepared as CSV and landed for load.
2. **Load to PostgreSQL** — tables created in `CCDB`, loaded, and indexed on `CLIENT_ID` and week key.
3. **Model in Power BI** — direct PostgreSQL connection; three derived columns added at the semantic layer: `age_group` (<30, 20–30, 30–40, 40–50, 50–60, 60+), `income_group` (Low/Medium/High) and `revenue` = annual fees + interest earned + transaction amount.
4. **Measure layer** — DAX measures for `CURRENT_WEEK_REVENUE`, `PREVIOUS_WEEK_REVENUE`, `WOW_INCREASE`, `SUM_REVENUE`, `DELINQUENT_RATE` and `ACTIVATION_RATE`. A surrogate `WEEK_NUM_2` column works around the source week field's non-sortable type.
5. **Publish and iterate weekly** — two dashboards (transaction and customer), filtered by quarter, week, gender, card category and usage channel; refreshed by loading 185-row weekly files.

2.3 Metric definitions

Three definitions carry most of the analytical weight and are stated explicitly because they are where this report departs from the client document's framing.

TABLE 2 — CORE METRIC DEFINITIONS USED IN THIS REPORT

METRIC	DEFINITION	WHY THE DEFINITION MATTERS
Gross billings	Annual fees + interest earned + transaction amount (the client's `revenue` column)	Correct as a *volume* measure, but 80.6% of it is pass-through settlement value, not income
Economic revenue	Interest earned + annual fees = gross billings − transaction amount	The defensible revenue base: US$10.98M YTD, 19.4% of gross billings
Transaction yield	Interest earned ÷ transaction amount	17.6% — the true monetisation rate on spend
Activation rate	Share of accounts transacting within 30 days of issue	57.5% YTD; the inverse is the recoverable base
Delinquency rate	Share of accounts flagged delinquent in period	6.06% YTD; 5.41% in Week 53
Return on acquisition spend	Gross billings by card category ÷ acquisition cost by card category	Comparable efficiency ratio across tiers, independent of account counts

2.4 Validation and reconciliation

The Week 53 load was validated against the prior year-to-date position. The test is decisive: if the incremental feed is additive and correctly keyed, the change in each YTD total should equal the Week 53 figure exactly.

TABLE 3 — INCREMENTAL-LOAD RECONCILIATION (WEEK 52 → WEEK 53)

MEASURE	YTD AT W52	YTD AT W53	CHANGE	WEEK 53 DASHBOARD	RESULT
Gross billings	55,315,545	56,517,145	1,201,600	1,201,600	✓ **Exact**
Interest earned	7,843,382	7,982,480	139,098	139,098	✓ **Exact**

MEASURE	YTD AT W52	YTD AT W53	CHANGE	WEEK 53 DASHBOARD	RESULT
Transaction amount	44,522,013	45,533,021	1,011,008	1,011,008	✓ Exact
Card-category split	4 tiers	4 tiers	—	Sums to 1,201,600	✓ Exact
Gender split	55.32M	56.52M	—	708.1K + 493.5K	✓ Exact

All five tests pass. The arithmetic integrity of the incremental load is confirmed at the cent level, which means the anomalies reported in Section 3.6 are presentational rather than computational.

2.5 Methodological limitations

- **No event-level transaction table was supplied.** Findings rest on pre-aggregated dashboard extracts; distributions, cohort curves and time-series decompositions cannot be computed from the source as delivered.
- **Account counts by card category are not published.** Tier comparisons therefore use revenue and acquisition-cost shares rather than per-account economics.
- **Acquisition cost is under-scoped.** Total CAC of US$0.98M equals 1.77% of gross billings and roughly US$97 per account. Industry card-acquisition costs are typically an order of magnitude higher, so the reported CAC almost certainly captures direct costs only. All return-on-acquisition figures in this report are therefore *relative* tier comparisons, not absolute payback claims.
- **One year of data.** Week 53 falls in the holiday peak; without a prior-year Week 53 no seasonal index can be estimated, so seasonality is inferred from the quarterly pattern and the account-flow arithmetic rather than modelled.
- **Impact estimates are stated as assumptions.** Every value in Section 4 carries its formula, a ramp assumption and a confidence rating; none is presented as a forecast.

SECTION 03

Key findings

3.1 Portfolio economics: a payments business with a lending margin

Year-to-date gross billings of US$56.52M decompose into US$45.53M of transaction value (80.6%), US$7.98M of interest (14.1%) and US$3.00M of annual fees (5.3%). Removing the pass-through layer leaves **US$10.98M of economic revenue** — the number that should anchor every budget, target and efficiency ratio in the business.

TABLE 4 — REVENUE DECOMPOSITION, FY2025 (YTD TO WEEK 53)

COMPONENT	YTD (US$)	% OF GROSS	PER ACCOUNT (US$)	INTERPRETATION
Transaction amount	45,533,021	80.6%	4,505	Pass-through settlement value; not income
Interest earned	7,982,480	14.1%	790	Primary economic engine
Annual fees	3,001,644	5.3%	297	Highest-margin, lowest-risk revenue
Gross billings	**56,517,145**	**100.0%**	**5,591**	**Volume measure only**
Economic revenue	**10,984,124**	**19.4%**	**1,087**	**Decision-grade revenue base**

Derived: annual fees = gross billings − interest − transaction amount. Transaction yield (interest ÷ transaction amount) = 17.6%. YTD transaction count 667.3K implies 66 transactions per account at an average ticket of US$68.23.

3.2 Card mix: premium tiers are efficiently acquired and poorly monetised

The portfolio is overwhelmingly a single-product book. Blue accounts for 83.5% of gross billings and 83.0% of transaction value; Blue and Silver together contribute 93.3% of transactions.

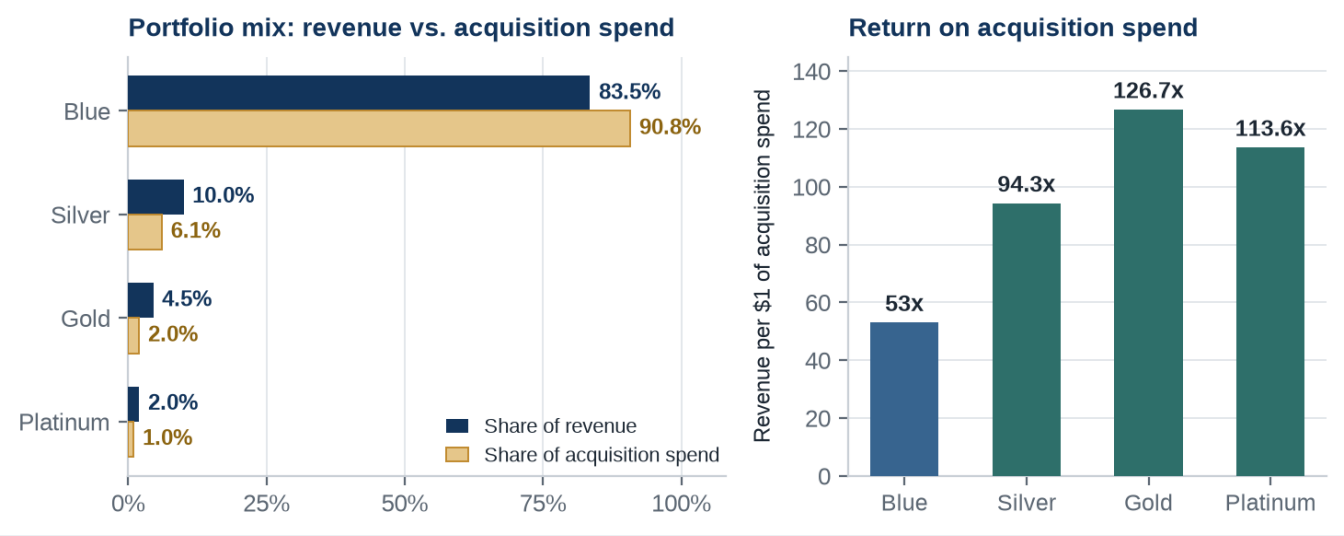

FIGURE 1 — Revenue share versus acquisition-spend share by card category (left), and the resulting return on acquisition spend (right). Blue absorbs 90.8% of acquisition spend for 83.4% of billings; the three premium tiers convert every dollar of spend into roughly twice as much billings.

TABLE 5 — CARD CATEGORY PERFORMANCE, FY2025 YTD

CATEGORY	GROSS BILLINGS	REV. SHARE	INTEREST	FEE INCOME	FEE INTENSITY	ACQ. COST	RETURN
Blue	47,188,733	83.5%	6,614,173	2,733,811	5.8%	890,000	53.0×
Silver	5,659,121	10.0%	821,923	189,602	3.4%	60,000	94.3×
Gold	2,533,683	4.5%	384,755	57,566	2.3%	20,000	126.7×
Platinum	1,135,608	2.0%	161,629	20,665	1.8%	10,000	113.6×
Total	**56,517,145**	**100.0%**	**7,982,480**	**3,001,644**	**5.3%**	**980,000**	**57.7×**

Fee income derived per tier (see Table 4 note). Fee intensity = fee income ÷ gross billings. Return = gross billings ÷ acquisition cost, a relative efficiency ratio only — see the CAC caveat in Section 2.5.

Two structural facts stand out. First, **the premium tiers are acquired at one-tenth the cost intensity but generate one-fifth the revenue share**: they are a small, efficient niche rather than the margin engine a card portfolio normally relies on. Second, and more diagnostically, **fee intensity declines monotonically as tier rises** — 5.8% on Blue, 3.4% on Silver, 2.3% on Gold, 1.8% on Platinum. Interest intensity is flat across all four tiers (14.1%–15.2%). The premium proposition is therefore delivering higher limits and prestige without the fee-based economics that normally justify it; the tiers are being sold on transaction capability, not on relationship value.

3.3 Trajectory: flat quarters, one exceptional week

Quarterly gross billings moved inside a US$0.9M band across the year — Q1 $14.0M, Q2 $13.8M, Q3 $14.2M, Q4 $13.3M as at Week 52. Transaction counts followed the same flat profile, ranging from 161.6K to 166.6K. This is a mature, stable book with no organic growth trend.

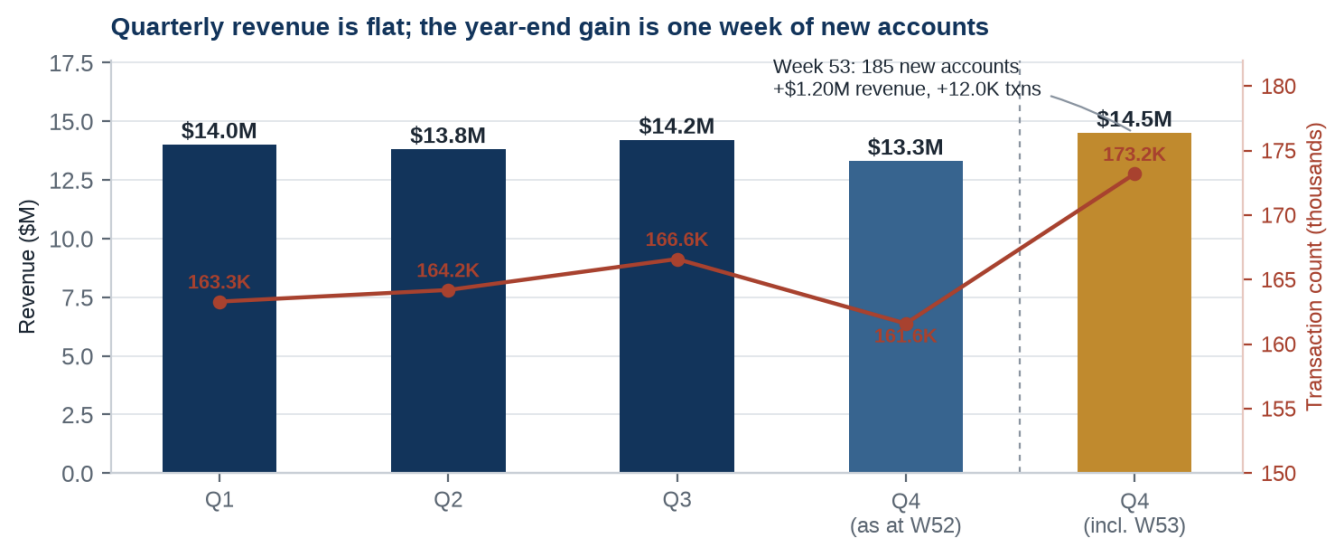

FIGURE 2 — Quarterly gross billings (bars) and transaction count (line). Q4 is the weakest quarter on the pre-load basis; including Week 53 it becomes the strongest at $14.5M and 173.2K transactions. Roughly 8.3% of Q4 revenue sits in that single week.

3.4 Week 53: what the 28.8% actually measures

Week 53 (31 December 2025) added US$1,201,600 of gross billings, US$1,011,008 of transaction value and US$139,098 of interest, on 185 new accounts. Against an implied prior week of US$932,919, that is a 28.8% week-over-week increase. The dashboard reports it as portfolio growth; the arithmetic says otherwise.

TABLE 6 — DECOMPOSING THE WEEK 53 UPLIFT

ATTRIBUTION TEST	VALUE	READING
Week 53 gross billings	1,201,600	Reported as +28.8% WoW
Average week, FY2025	1,066,361	Week 53 is 12.7% above the average week
New accounts loaded	185	1.83% of the 10,108-account base
Billings attributable to new accounts (at portfolio average)	19,890	1.7% of the week's billings
Unexplained by acquisition	1,181,710	98.3% — seasonal and behavioural
Annualised at Week 53 rate	62,483,200	+10.6% vs YTD; a seasonality artefact, not a run-rate

The implication is practical rather than academic. **Acquisition campaigns in this portfolio cannot be evaluated on their launch-week revenue.** New accounts contribute at roughly portfolio-average rates on a part-week basis and are not yet funded or habituated; the Week 53 number is dominated by existing-cardholder holiday spend. Campaign economics should be judged on 4–8 week cohorts against a matched control, not on the week the file lands.

3.5 Customer behaviour: where the spend actually goes

Occupation, education and age structure the book more strongly than gender does. Businessmen contribute 31.4% of billings, and the 40–50 and 50–60 age bands together account for roughly 79% of billings on the dashboard's labelled segments. Graduates are the single largest education cohort at 40.3%.

TABLE 7 — REVENUE BY OCCUPATION AND GENDER, FY2025 YTD (US$ THOUSANDS)

OCCUPATION	MALE	FEMALE	TOTAL	SHARE	MALE SHARE OF SEGMENT
Businessman	8,403	8,985	17,388	31.4%	48.3%
White-collar	7,103	3,012	10,115	18.3%	70.2%
Self-employed	3,076	5,186	8,262	14.9%	37.2%
Government	5,268	2,844	8,112	14.7%	64.9%
Blue-collar	3,823	3,082	6,905	12.5%	55.4%
Retirees	2,550	1,985	4,535	8.2%	56.2%
Total	**30,223**	**25,094**	**55,317**	**100.0%**	**54.6%**

Segment totals reconcile to the US$55.32M Week-52 position. Gender totals match the dashboard's 30.22M / 25.09M split. Businessman is the only materially gender-balanced high-value segment; white-collar and government skew male, self-employed skews female.

Spend mix is more stable than it first appears. Bills dominate the year at 24.9% of billings, followed by entertainment (17.2%) and fuel (16.8%) — but at year-end the mix rotates sharply toward discretionary categories. Entertainment and fuel together rise from 34.0% of billings for the year to **43.3% in Week 53**, while bills fall from 24.9% to 18.8% and travel rises from 10.6% to 14.3%. That rotation is the seasonal signature behind the Week 53 spike, and it is directly useful for campaign timing.

TABLE 8 — SPEND CATEGORY MIX: ANNUAL VERSUS WEEK 53

CATEGORY	ANNUAL (US$M)	ANNUAL SHARE	WEEK 53 (US$K)	WEEK 53 SHARE	SHIFT
Bills	13.8	24.9%	226.3	18.8%	**−6.1 pts**
Entertainment	9.5	17.2%	260.2	21.7%	**+4.5 pts**
Fuel	9.3	16.8%	260.0	21.6%	**+4.8 pts**
Grocery	8.6	15.5%	159.2	13.2%	**−2.3 pts**
Food	8.3	15.0%	124.7	10.4%	**−4.6 pts**
Travel	5.9	10.6%	171.3	14.3%	**+3.6 pts**
Total	**55.4**	**100.0%**	**1,201.6**	**100.0%**	**—**

Channel behaviour is the least healthy pattern in the file. **Swipe carries 62.4% of Week 53 billings, chip 30.9% and online just 6.7%** — figures closely matching the annual mix. A portfolio where two-thirds of value runs through the highest-cost, least-data-rich acceptance path, and where the digital channel is a rounding error, has limited capacity to run personalised or merchant-funded offers. Married cardholders contribute 53.5% of Week 53 billings, consistent with the household-spend profile the category mix implies.

3.6 Portfolio quality, and three reconciliation anomalies

Activation at 57.5% and delinquency at 6.06% are the two quality constraints on the whole book; Week 53 moved delinquency favourably to 5.41% and activation marginally to 56.8%, both consistent with a holiday-spend week.

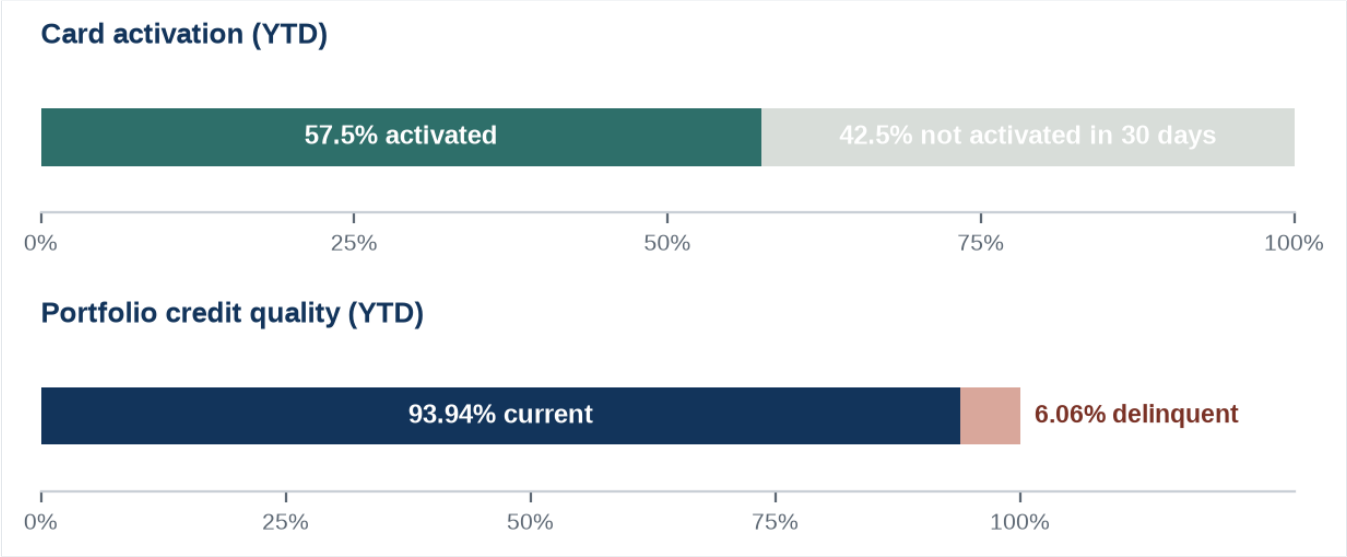

FIGURE 3 — The two quality constraints, YTD. The activation gap (42.5%, ~4,296 accounts) is the recoverable asset; delinquency (6.06%, ~613 accounts) is the exposure to contain.

Three figures in the source document do not survive scrutiny and should be corrected before the report is circulated further. None affects the financial totals — the reconciliation in Table 3 is exact — but each would mislead a decision-maker reading the dashboards:

TABLE 9 — RECONCILIATION ANOMALIES IDENTIFIED IN THE SOURCE DASHBOARDS

REPORTED	WHAT THE DATA SHOWS	RECOMMENDED CORRECTION
"TX, NY & CA contribute 77%" (Week 52) versus "68%" (YTD)	Adding 185 accounts cannot move a three-state share by 9 points.	The two views use different filter contexts or denominators. Restate both on the same YTD base and publish the denominator alongside the share.
"Customer count increased by 12.8%"	185 new accounts on 10,108 is +1.83%. A 12.8% rise implies roughly 1,300 additional customers.	This is a week-over-week comparison of *active* customers, not total accounts. Relabel it as active-customer change.
"Revenue increased by −1M (UP 28%)"	Week 53 gross billings are US$1,201,600 against an implied US$932,919 prior week: +28.8%, and positive in absolute terms.	Typographical; restate as "+US$0.27M, +28.8%" to avoid a sign contradiction in the client pack.

A fourth observation is a measurement caution rather than an error: the activation rate is reported as 57.5% at both Week 52 and Week 53 despite a 1.8% base addition. At one-decimal precision a genuine half-point move would be invisible, so the figure cannot be used to judge whether onboarding improved during the period. Publishing activation to two decimals, and split by cohort, is a low-cost fix with high decision value.

SECTION 04

Business insights and recommendations

What the analysis means commercially, sized in revenue and cash, and sequenced into an executable programme. Every impact figure states its formula and confidence; totals are additive and deliberately conservative.

1 Reframe the business on US$10.98M, not US$56.5M

FINDING	80.6% of gross billings is pass-through settlement value. Economic revenue — interest plus fees — is US$10.98M, or US$1,087 per account.
WHY IT MATTERS	Every target, incentive and efficiency ratio built on gross billings rewards spend volume rather than margin. A 10% lift in transaction value with no change in yield adds nothing to the P&L; the same 10% delivered through interest or fee mix adds US$1.10M.
IMPACT	**Corrects the denominator for all planning. US$3.65M of recommended actions is +6.4% on gross billings but +33% on economic revenue — a materially different investment case.**
DO THIS	**Publish economic revenue as the primary KPI on both dashboards, with gross billings retained as a secondary volume measure. Restate FY2026 targets on the US$10.98M base within one reporting cycle.**

2 Treat the 42.5% activation gap as the priority revenue lever

FINDING	4,296 accounts (42.5%) did not transact within 30 days of issue. At an average of US$5,591 of annual billings per account, that dormant base represents US$24.0M of latent annual billings.
WHY IT MATTERS	Acquisition spend has already been incurred on these accounts. Activation is the only lever in this portfolio where the cost of the customer is sunk and the marginal revenue is close to pure margin. It is also the fastest lever: a 30-day activation intervention acts inside the current quarter.
IMPACT	**+5 points of activation = 505 newly active accounts × US$5,591 × 60% first-year utilisation = US$1.70M annual gross billings, US$1.13M in year one. Programme cost at one CAC-equivalent per account (US$97) is about US$49K — a 34× return. Sensitivity: ±2 points of activation moves the figure by ±US$0.68M.**
DO THIS	**Launch a day 3 / 10 / 21 activation sequence (SMS plus first-spend incentive), prioritised on businessmen and white-collar segments where revenue per account is highest. Report activation by issue cohort at two decimals so the intervention can be measured.**

3 Reallocate acquisition spend toward premium tiers

FINDING	Blue takes 90.8% of acquisition spend for 83.5% of billings (53.0× return). The three premium tiers take 9.2% of spend for 16.5% of billings (104× blended return). Fee intensity falls as tier rises: 5.8% → 3.4% → 2.3% → 1.8%.
WHY IT MATTERS	Two problems in one pattern. The premium book is starved of acquisition investment despite the best conversion economics in the portfolio, and even where it exists it is monetised as a transaction product rather than a fee product. Fixing acquisition mix without fixing fee architecture would grow a book that cannot charge for itself.
IMPACT	**A 10-point shift of the US$0.89M Blue allocation (US$89K) redeployed at the premium blended return of 104× represents roughly US$9.2M of acquisition capacity — theoretical headroom, not near-term revenue, and the strongest structural argument for rebalancing. Raising Platinum fee intensity from 1.8% to 3.0% adds about US$14K per US$1.2M of Platinum billings.**
DO THIS	**Rebalance 10–15% of acquisition budget to Gold and Platinum over two quarters. Attach a fee-bearing benefit set (lounge, insurance, FX) to justify a priced upgrade path, and track fee intensity per tier as the tier's primary health metric rather than billings share.**

4 Diversify beyond three states — with a segment-matched playbook

FINDING	TX, NY and CA carry 68% of YTD billings. The remaining 40+ states carry 32% between them. The book has no demonstrated acquisition engine outside the three core markets.
WHY IT MATTERS	This is a concentration risk before it is a growth opportunity. A single state-level shock — regulatory, competitive or economic — propagates across two-thirds of revenue. The 28.8% Week 53 spike also shows how thin the base of growth is: one seasonal week can dominate a quarter.
IMPACT	**+3 points of billings from outside the core three = US$1.70M annual gross billings, US$0.85M in year one on a 50% ramp. The same +3 points is +15% growth on the non-core base, which is a realistic two-market entry rather than a national programme.**
DO THIS	**Select two states by the profile of the current high-value segments — graduate, 40–60, businessman or white-collar — and run a 12-month city-level pilot with corporate tie-ins for business cardholders. Fund it from the Blue reallocation in Insight 3 rather than incremental budget.**

5 Tighten self-employed underwriting, not self-employed acquisition

FINDING	Self-employed cardholders are 14.9% of billings but contribute 1.65 of the 6.06 delinquency points — about 27% of total credit loss from 15% of revenue. Conditional delinquency is ~11%, roughly 1.8× the portfolio average. The segment also skews female (63%), the only high-value segment that does.
WHY IT MATTERS	The natural response — cut the segment — would surrender US$8.26M of billings to remove a loss contribution that is better addressed at the point of decision. The exposure is a underwriting-design problem, not a segment problem. Roughly US$3.42M of gross billings (US$0.67M of economic revenue) sits in delinquent accounts today.
IMPACT	**Reducing the self-employed delinquency contribution by 0.45 points — 60% of its excess over average, ~45 accounts — protects US$254K of annual billings. Full convergence to portfolio average would protect approximately US$0.42M. Treat this as loss avoidance with high confidence, not as revenue growth.**
DO THIS	**Introduce income-verification and a lower initial limit for self-employed applicants, with a documented limit-increase path after six months of on-time payment. Hold acquisition volume flat; change the terms, not the target.**

6 Shift the channel mix and use the seasonal window

FINDING	Online carries 6.7% of Week 53 billings against 62.4% through swipe. Entertainment and fuel rise from 34.0% of annual billings to 43.3% in Week 53; travel rises from 10.6% to 14.3%; bills fall 6.1 points.
WHY IT MATTERS	Swipe is the most expensive acceptance path and yields the least transaction data, which caps the portfolio's ability to run merchant-funded offers or personalised rewards — the levers that would raise economic revenue without raising volume. The seasonal rotation, meanwhile, is a known and schedulable demand window.
IMPACT	**Direct gain is modest and is *not* counted in the US$3.65M: shifting 5 points of transaction value to online at a 40 bps acceptance differential is worth about US$9K a year. The material value is indirect — the online channel generates the transaction-level data that merchant-funded offers require, and the entertainment/fuel/travel window is where a first-spend offer converts best, making it the right timing for the activation programme in Insight 2.**
DO THIS	**Run an online-first activation offer for the 4,296 dormant accounts in the September–November window, timed to the entertainment/fuel/travel rotation. Publish acceptance-channel cost per dollar of billings so the channel mix becomes a managed number.**

4.7 Consolidated impact

The three primary levers are additive and independently estimated. Together they represent **US$3.65M of annual gross billings (+6.4%) and US$2.23M of first-year cash**, with the channel and premium-mix actions treated as upside rather than counted in the total.

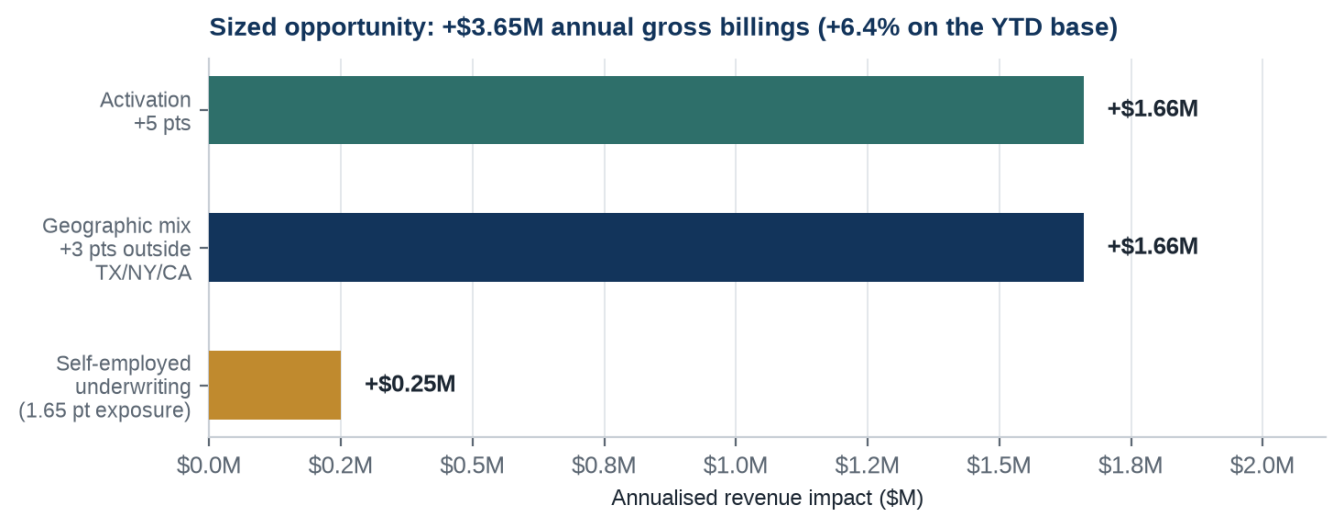

FIGURE 4 — Sized annual impact of the three additive levers. Activation and geographic diversification each contribute US$1.70M; self-employed underwriting protects US$0.25M. Channel and premium-mix actions sit outside the total.

TABLE 10 — IMPACT SUMMARY AND CONFIDENCE

LEVER	ACCOUNTS AFFECTED	ANNUAL GROSS BILLINGS	YEAR-ONE CASH	CONFIDENCE	BASIS
Activation +5 points	505	+$1.70M	+$1.13M	Medium	Accounts × US$5,591 × 60% utilisation; 8-month in-year effect
Geographic +3 points	—	+$1.70M	+$0.85M	Medium-low	3% of YTD billings;

LEVER	ACCOUNTS AFFECTED	ANNUAL GROSS BILLINGS	YEAR-ONE CASH	CONFIDENCE	BASIS
					50% first-year ramp
Self-employed underwriting	~45	+$0.25M	+$0.25M	High	0.45 points of delinquency × US$5,591 per account (loss avoided)
Total additive	**550**	**+$3.65M**	**+$2.23M**	**—**	**+6.4% on gross billings; +33% on economic revenue**
Channel mix (upside)	—	+$0.01M	+$0.01M	High	5-point shift at 40 bps acceptance differential; strategic value is data
Premium reallocation (structural)	—	capacity	—	Low	US$89K redeployed at 102× blended return — headroom, not revenue

Year-one cash applies a ramp to the annualised figure: activation assumes 8 of 12 months' effect; geographic assumes 50% ramp; loss avoidance is taken at full value. Confidence reflects data support, not implementation risk.

4.8 Sequenced action plan

Sequencing matters more than ambition here. Activation is cheap, fast and internally executable; geographic expansion is slow and requires capability; underwriting change is a policy decision with an immediate risk benefit. Run them in that order.

TABLE 11 — PRIORITISED PROGRAMME, NEXT FOUR QUARTERS

#	ACTION	OWNER	HORIZON	VALUE	SUCCESS MEASURE
1	**Publish economic revenue as the primary KPI**	Analytics / Finance	Q1	Enables all	Both dashboards restated; FY26 targets on the US$10.98M base
2	**Day 3/10/21 activation sequence**	Cards marketing	Q1–Q2	+$1.70M	Activation 57.5% → 62.5% within two cohorts
3	**Self-employed underwriting and limit policy**	Risk / Credit policy	Q1	+$0.25M	Segment delinquency contribution 1.65 → 1.20 points
4	**Rebalance 10–15% of acquisition to premium**	Product / Acquisition	Q2–Q3	Structural	Premium share of billings 16.5% → 20%; fee intensity on Platinum ≥3.0%
5	**Two-state pilot outside TX/NY/CA**	Growth	Q2–Q4	+$1.70M	Non-core share of billings 32% → 35%
6	**Online-first seasonal campaign**	Digital	Q4	Enables #2	Online share 6.7% → 11.7%; acceptance cost per dollar tracked

TWO PRACTICES TO RETIRE

Stop quoting portfolio scale on gross billings. An 80.6% pass-through component makes the business look four times larger than its revenue and rewards the wrong behaviour in every downstream incentive.

Stop reading the Week 53 uplift as growth. A 28.8% week-over-week gain driven 98% by seasonal spend on an existing base will not repeat in January. Judge acquisition on 4–8 week cohorts, and report growth on a rolling four-week basis to remove the holiday effect entirely.

SECTION 05

Appendix: definitions, reconciliation and limitations

A.1 Derived figures and their formulas

TABLE 12 — DERIVED MEASURES USED IN THIS REPORT

MEASURE	FORMULA	VALUE
Fee income	Gross billings − interest − transaction amount	$3,001,644
Economic revenue	Interest + fee income	$10,984,124
Transaction yield	Interest ÷ transaction amount	17.6%
Billings per account	Gross billings ÷ 10,108 accounts	$5,591
Economic revenue per account	Economic revenue ÷ 10,108	$1,087
Acquisition cost per account	$980,000 ÷ 10,108	$97
Average week	Gross billings ÷ 53 weeks	$1,066,361
Week 53 uplift vs average	$1,201,600 ÷ $1,066,361 − 1	+12.7%
Prior-week billings (implied)	$1,201,600 ÷ 1.288	$932,919
Delinquent accounts	10,108 × 6.06%	≈ 613
Dormant accounts	10,108 × 42.5%	≈ 4,296
Conditional self-employed delinquency	1.65 points ÷ 14.9% revenue share	≈ 11.0%

A.2 Data quality register

TABLE 13 — KNOWN DATA ISSUES CARRIED FORWARD

ID	ISSUE	SEVERITY	DISPOSITION
Q1	**Three-state share reported as 77% and 68%**	**Medium**	Excluded from trend claims; flagged for restatement (Table 9)
Q2	**Customer count growth of 12.8% inconsistent with a 185-account load**	**Medium**	Interpreted as active-customer change; not used in any calculation
Q3	**Activation rate flat at one decimal across the load**	Low	Recommend two-decimal, cohort-level reporting

ID	ISSUE	SEVERITY	DISPOSITION
Q4	**Acquisition cost appears to exclude indirect marketing**	**High**	Returns expressed as relative tier comparisons only
Q5	**No event-level transaction table supplied**	Medium	Cohort and distribution analysis deferred; impact estimates use averages
Q6	**Age and dependent panels are a subset of total billings**	Low	Used qualitatively; shares not extrapolated to portfolio totals

A.3 Basis of preparation

All figures in this report are taken from the client's submitted *Analysis.docx* and its six embedded Power BI dashboard extracts, or derived from them using the formulas in Table 12. No external data has been introduced. Where the source document and the dashboards differ, the dashboard figure has been used and the difference noted. Impact estimates in Section 4 are stated assumptions constructed from portfolio averages — they are decision-support ranges, not forecasts — and each carries the formula, ramp and confidence rating needed to challenge or replace it.

Technical report · Credit Card Portfolio Performance & Weekly Revenue Analytics · FY2025 (Weeks 1–53) · Prepared 21 October 2026 · Internal decision support. Analysis based on the client-supplied Analysis.docx and associated dashboard extracts; figures rounded for presentation and may not sum exactly.
